

MONK MEDIA CRM

Operations & User Manual

A comprehensive guide to managing client portals, projects, financial pipelines, and contractor credentials in the Monk Media CRM ecosystem.

Generated: July 29, 2026

Version 2.0 (Latest Release)

1. Introduction & Architecture

The Monk Media CRM is a custom-engineered Client Relationship Management platform designed specifically for creative agencies managing content production, social media, and ad campaigns. Built using React, Next.js, and Firebase Firestore, the app features real-time data observers to ensure instant updates without page refreshes.

Key Ecosystem Roles:

- **Administrators (Full Access):** Full workspace controls, user creation, password resets, financial settings, and agency reports.
- **Account Managers (Scoped Controls):** Manage campaigns and tasks for assigned clients and projects.
- **Team Members / Contractors:** View assigned tasks, content pipelines, calendars, and log task execution.

2. Global Search Navigation

We have redesigned the navigation architecture to prioritize efficiency and screen space. The search functionality has been upgraded from a floating button to an integrated system widget.

Search Relocation details:

- **Header Bar Pill:** The search input is located inside the top Dashboard Header next to the welcome greeting.
- **Keyboard Shortcut:** Pressing 'Ctrl + K' (or Cmd + K on macOS) instantly toggles the search overlay.
- **Indexed Records:** The overlay searches in real-time across Clients, Projects, Tasks, Leads, Team Members, and Invoices.

3. Campaign Management & Kanban Board

The Projects screen acts as the operational nerve center for campaign execution. The interface features a revamped Kanban board styled using pure Tailwind CSS classes.

Kanban Features:

- **Glassmorphic Headers:** Status columns use styled, matching color schemes for clear staging visibility.
- **Visual Campaign Cards:** Display client names in badge blocks, project values in emerald badges, and calendar timeline scopes.
- **Progress Indicators:** Highlight completed campaigns with emerald checkmarks and active campaigns with animated activity icons.
- **Administrative Actions:** Inline dropdowns, project deletion, billing triggers ('Bill'), and log payment options ('Pay') are integrated directly into the cards.

4. Client Profile Dashboards

Each client has a dedicated, multi-tab dashboard compiling their operational and financial pipeline. Navigation tabs use a glassmorphic container layout for premium aesthetics.

Profile Tabs Breakdown:

- Overview: Client contact info, company description, and industry details.
- Projects: Add and view all client campaigns.
- Payments: Manage monthly retainers, tax setups, and manual invoice tracking.
- Content Calendar: Real-time schedule of videos, shoots, and editing status.
- Documents Registry: Storing file registries (Base64 direct database uploads).
- Account Links: Storing social links, Google Drive portals, and assets.
- Onboarding Checklist: Select, track, and link agency milestones.

5. Onboarding Checklists & Documents

Onboarding and asset management have been streamlined to reduce data storage overhead.

Onboarding Milestones:

- Agency Milestones: Admin selects from 17 core agency milestones to track.
- Tracked Table: Display tracked milestones in a clean grid showing associated projects, project values, deadlines, and statuses.

Documents Registry Table:

- Base64 Uploads: Files are converted in the browser to Base64 strings and stored directly in the Firestore database.
- File Previews: Previews are rendered as image thumbnails (for graphic assets) or file type icons (for PDFs and documents).

6. WhatsApp Credentials Sharing

For increased security and faster onboarding, we have integrated a custom credentials sharing panel that communicates directly with contractor and manager devices.

WhatsApp Integrations:

- **Create Team Member Card:** Displays a share input pre-filled with the user's phone number upon successful registration.
- **Reset Password Portal:** Displays a WhatsApp button next to completed reset requests, automatically pulling the user's registered phone number from their profile document.
- **Pre-filled Message:** Opens the WhatsApp API link pre-filled with their login email, temporary credentials, and correct login portal link.
